

## **Various consistency statements and their behavior in weak arithmetics**

Zofia Adamowicz

Institute of Mathematics of the Polish Academy of sciences

We introduce some new definitions of initial segments of models of arithmetic. In some models those definitions define the standard cut. We formulate statements expressing consistency over the above initial segments. In weak arithmetic our consistency statements behave better than the classical ones. We compare them with the classical consistency statements. In particular we show the Gödel phenomenon for them. Finally we ask a few questions.
